Length of injecting career and choice of drug were not associated with an inadvertent injection. These findings suggest that a significant number of injection drug users in Montreal, particularly women and older users, are at risk for toxin-mediated fatal infections if contaminated heroin enters the market, even if only intravenous injections are planned.

Because smoking is a less cost-effective route of heroin administration than injection, many users are unlikely to follow the advice to switch to smoking. Serious consideration should be given to encouraging physicians to prescribe sterile injection equipment, to increasing treatment slots, to setting up injection rooms staffed by nurses who can provide advice on safe injection techniques, to conducting clinical trials of medical-quality heroin in people for whom methadone substitution has failed and to instituting strictly supervised programs for long-term injectors. This would reduce the risk of life-threatening infection from nonsterilized drugs, prevent overdose from heroin of unknown purity, break the link between drug use and criminal activity to acquire drugs and decrease the number of injections in public places.

An author by any other name

I enjoyed the commentary describing the revised author-declaration rules in the Sept. 19th issue. From the description of Attila Lorincz’s contribution to the article on human papillomavirus DNA testing in the same issue, I am uncertain of the justification for Lorincz’s inclusion as a coauthor.
Did I overlook a key piece of information? Or were you just testing to see if your readers are paying attention?

Of course, this raises another question: Are journal editors and their staff (and peer reviewers) now going to be expected to review the authors’ contributions and decide whether each of the proposed authors should be listed, or will this responsibility fall to the group of proposed authors (an honour system)?

[The editor of CMAJ responds]

A tip of our hat to Bart Harvey — we missed that one. Attila Lorincz did in fact meet the revised authorship criteria of the Vancouver Group.1 However, he neglected to inform us that he participated in the design and analysis of the study as well as providing a critical review of the manuscript,2 thus qualifying him for authorship.

We will be more vigilant; editors can and should raise questions when they suspect that authorship criteria have been violated. But, as Harvey suggests, the main responsibility for ensuring that the authorship criteria are met lies with the authors.

John Hoey
