Go local, European review of electronic health records advises

Grandiose nation-wide electronic health record (EHR) systems aimed at aggregating patient data into general summaries may not be feasible, necessary or medically justified, according to a European Commission report.

The review of European ehealth investments suggests that decentralized approaches are preferable. Large-scale systems are “much more difficult than you ever dreamt of,” says Karl Stroetmann, lead author of the stock-taking survey (www.ehealth-strategies.eu/report/eHealth_Strategies_Final_Report_Web.pdf).

“It takes much more time and it takes much more money than was expected,” Stroetmann adds. “We found everywhere that local efforts work better than national efforts. And that’s because healthcare itself is mostly local.”

The report, *European countries on their journey towards national ehealth infrastructures*, helps put Canada’s ehealth quandary into perspective, says Dr. Robyn Tamblyn, professor of medicine McGill University in Montreal, Quebec, scientific director of the Canadian Institutes of Health Research’s Institute of Health Services and Policy Research, and member of McGill’s Clinical and Health Informatics Research Group. Tamblyn’s group has found that Canada Health Infoway’s efforts to build a complex nationwide health “infostructure” emphasized national over regional investment, while failing to link the implementation of ehealth technologies to strategic health objectives such as “improvements in patient safety, management of chronic diseases and sustainability of the health care system” (www.cmaj.ca/cgi/doi/10.1503/cmaj.100856).

The European report reinforces arguments that Canada needs to retreat from an ehealth approach driven by bureaucrats and software executives. “The best way to build these systems is to let doctors and other healthcare professionals drive the entire process,” says Stroetmann, citing Scotland as a case where an advanced system was inexpensively crafted by physicians.

Stroetmann says Europe leads the world in constructing smaller scale, regional ehealth systems rather than national scale ones like the one sought by Canada Health Infoway. Only Spain’s Andulacia province has achieved a broader scale system and is “well on its way to becoming the first true regional EHR system for a significant sized population (over 8 million) fully integrating all patient information from primary to tertiary care including emergency and in-patient care, also connecting all pharmacies, their logistics and billing,” the report states.

Large, national systems are not yet feasible beyond a certain level, the report adds. “It seems that the complexity of national EHR systems cannot be managed in larger countries. European experience so far suggests that countries with more than around 10m inhabitants tend to fail with their endeavours, particularly if they do not feature a top-down healthcare system. It is also increasingly evident that clinicians’ enthusiasm for comprehensive electronic health records, which may connect patient data in diverse

record systems, relates primarily to perceived benefits in their immediate surroundings. This would suggest a middle-out approach, opting for local and regional systems building on a national infrastructure. Seamless national exchange of core patient data like summaries could be assured via common data models.”

Stroetmann says Europe is increasingly looking to focus its efforts on an interoperable, inter-regional system, known as Smart Open Services for European Patients, that aspires to the more limited objective of connecting 12 nations to a secure database sharing only basic patient summaries and prescription records.

It only has a budget of about \$30 million but “sometimes, too much money is not enough of a solution,” Frank Linden, the project’s director said during a presentation in Vancouver, British Columbia in June 2010.

The report notes that the clinical need for large-scale national systems “is being questioned more and more” and that clinical enthusiasm for such systems is waning. It also urges external, independent oversight of ehealth strategies and investments, which Canada lacks (www.cmaj.ca/cgi/doi/10.1503/cmaj.109-3783).

The need for external assessment is self-evident when vast sums of money are handed to ehealth bureaucrats, with minimal oversight and minimal opportunity for dialogue about goals and priorities, says Trisha Greenhalgh, director of the Healthcare Innovation and Policy Unit at Barts and the London School of Medicine and Dentistry, Queen Mary University of London in England.

Policymakers need to be more skeptical of demands for ehealth monies made by bureaucrats and industry, adds Aziz Sheikh, professor of primary care research and development at the University of Edinburgh in Scotland.

Many governments see ehealth investments as “the answer” without regard to the lack of evidence supporting the value of ehealth technologies, many of which remain primitive and require “working out,” Sheikh says. “It doesn’t really fit in with what politicians hoped.”

Trevor Hodge, senior vice president for investment strategy and alliances at Canada Health Infoway, noted in a blog (<http://infowayconnects.infoway-inforoute.ca/blog/global-perspectives/268-progress-report-european-e-health-initiatives/#axzz1KqQ6yIRO>) about the European report that “while many European countries are planning to implement EHR or patient summary systems, so far only a few countries have patient summary or limited, EHR-like services operational at the national level.” — Paul Christopher Webster, Toronto, Ont.
