

### Appendix 3: Per-protocol analysis of effectiveness of treatments at 13 weeks, stratified by location of warts (n=192)

	Treatment arm						<i>p</i> value*
	Cryotherapy		Salicylic acid		Awaiting		
	n	% cured (95%CI)	n	% cured (95%CI)	n	% cured (95%CI)	
All participants (n=192)	26/59	44 (32 to 57)	18/58	31 (21 to 44)	11/75	15 (8.4 to 24)	<0.001
Common wart group (n=88)	18/30	60 (42 to 75)	4/24	17 (6.7 to 36)	1/34	3 (<1 to 15)	<0.001
Plantar wart group (n=104)	8/29	28 (15 to 46)	14/34	41 (26 to 58)	10/41	24 (14 to 39)	0.66

Values are number of participants cured / number of participants in per-protocol analysis, and percentages of participants cured (95% confidence intervals [CIs]). A participant was considered cured when all of his or her warts present at baseline were gone.

\*Two-sided chi-square, linear-by-linear association, comparing the three treatment groups.
