

Appendix 9 (as supplied by the authors): Adjusted hazard ratios from Cox proportional hazard models on all-cause premature mortality among adults 18-82 years old at interview, by respondent's sex

Household food insecurity status	Male	Female
Food-secure (reference)	1.00 (ref)	1.00 (ref)
Marginally food-insecure	1.10 (1.00 - 1.22)	1.10 (0.99 - 1.21)
Moderately food-insecure	1.15 (1.06 - 1.25)	1.08 (0.99 - 1.17)
Severely food-insecure	1.39 (1.25 - 1.54)	1.35 (1.22 - 1.50)
Person-years	1,538,900	1,851,600

Note. Adjusted hazard ratios of food insecurity are displayed alongside 95% confidence interval in parentheses. The models adjusted for household income, highest education in household, household type, housing tenure, acute care hospitalization in the past two years, number of self-reported chronic conditions, smoker status, and past-year alcohol consumption history. Age at interview, hospitalization history, and self-reported chronic conditions were set as strata.
