

Supplementary Figure 5) Nomograms for both models with worked examples

Abdominal model nomogram

Variables

Points

Example calculation: A patient undergoing abdominal hysterectomy at age 40 (5.5 and 1.9 points), who is of Asian ethnicity (0.6 points), and not diabetic (0 points). She does not have fibroids (0.4 points) She does not have a menstrual disorder (1 point) or endometriosis/pain (0 points). She does have adenomyosis (0.1 point). She does not have a benign adnexal mass (0.3 points) and she has no other gynecological diagnosis at the time of hysterectomy (0.3 points). She has adhesions (1.4 points)

The total score is **11.9 points**. This corresponds to an **18%** risk of a major complication.
