^a FTC=emtricitabine, HR=hazard ratio, MSM=men who have sex with men, NA=not applicable, P-Y=person-years, RR=risk ratio, TDF=tenofovir disoproxil fumarate.

^b Data are from fourteen randomized controlled trials¹⁻¹⁴ and nine cohort studies¹⁵⁻²³.

^c When only one study was available, the presented value represents the effect size reported in the original study. When multiple randomized studies were available, presented values were estimated through meta-analysis using random-effects models, with weighting of studies according to the inverse variance method.

^d Includes two studies^{18,19} that enrolled small numbers of non-MSM.

^e Number of participants listed here is an overestimate since data from the placebo arm of the Partners PrEP study was used as the comparator for the Partners Continuation study also.
